

AMENDMENTS TO THE CLAIMS:

The listing of claims will replace all prior versions, and listings of claims in the application:

LISTING OF CLAIMS:

1. (currently amended) In a printshop having resources for performing various tasks to process print jobs, a method for optimizing the performance of the printshop, the method comprising the steps of:

partitioning the printshop into autonomous cells capable of receiving and processing print jobs;

dividing the resources ~~into~~ of the printshop between the autonomous cells, wherein each cell ~~has~~ contains sufficient resources to ~~produce a complete~~ at least one class of print job; and

assigning each print job to a ~~respective~~ selected one or more of the autonomous cells for printing wherein the autonomous cell contains resources capable of independently completing the print job.

2. (currently amended) The method of claim 1 wherein the resources include equipment for performing printing tasks and the resources may include printers, copiers, rollers, shrink wrappers, cutters, sealers and manual resources among others.

3. (currently amended) The method of claim 1 wherein the step of assigning print jobs comprises, for each given print job, determining what tasks need to be performed to complete the given print job and assigning the given print job to one of the autonomous cells that ~~has~~ contains sufficient resources for performing the tasks that need to be performed completed to complete fully process the given print job.

4. (currently amended) The method of claim 3 wherein the step of

assigning print jobs comprises, for each given print job, determining which of the autonomous cells has sufficient available capacity to print-completely process the given print job.

5. (original) The method of claim 1 wherein at least one of the autonomous cells includes more than one machine for performing a same operation.

6. (currently amended) The method of claim 1 further comprising the steps of:

determining classes of print jobs; and
assigning each print job to one of the classes.

7. (currently amended) The method of claim 6 wherein the determination of the class of print job is done based on collecting and analyzing print job data and on the tasks required to process the print job.

8. (currently amended) The method of claim 6 wherein the step of assigning each print job to a respective-selected one of the cells for printing processing is based in part on the classes to which the print jobs are assigned.

9. (currently amended) The method of claim 1 wherein a selected one of the cells is assigned multiple print jobs for concurrently printing-processing the multiple print jobs.

10. (currently amended) A method for optimizing the performance of a printshop, the method comprising the steps of:

providing a printshop that is partitioned into autonomous cells, each cell containing sufficient resources to complete a print job;

receiving a print job for printing-processing at the printshop;

sending the print job to a selected one of the autonomous cells having equipment-for-resources capable of completing the print job; and

at the selected autonomous cell, dividing the print job into lots and concurrently processing the lots ~~on separate items of the equipment in using the~~ resources of the selected autonomous cell.

11. (currently amended) The method of claim 10 wherein each cell contains multiple ~~pieces of equipment~~ resources for completing a print job.

12. (original) The method of claim 10 wherein the printshop has more than two autonomous cells.

13. (original) The method of claim 10 wherein the lots are roughly equal sized.

14. (original) The method of claim 10 wherein the dividing step is performed automatically by a machine.

15. (original) The method of claim 14 wherein the machine is a computer system.

16. (currently amended) A method of partitioning a printshop into autonomous cells, comprising the steps of:

identifying products produced by the printshop;

identifying operations required for producing each of the identified products;

determining printshop resources that are required for completing the identified operations;

determining a number of printshop resources required for operations to produce the products based on customer demand for products; and

partitioning printshop resources into autonomous cells based on the determined number of printshop resources required for operations to produce products based on customer demand for products, wherein each autonomous cell is independently capable of producing at least one of the identified products.

17. (original) The method of claim 16 wherein throughput of each autonomous cell is determined as a function of the printshop resources allocated to the autonomous cell, and wherein the printshop resources are allocated to each autonomous cell based on customer demand.

18. (currently amended) The method of claim 16 wherein the step of identifying products comprises identifying classes of print jobs produced by the printshop, wherein each class includes a sequence of operations that is performed ~~for to process the print jobs~~ of the class that differs from the sequence of operations performed ~~for to process~~ each of the other classes.

19. (original) The method of claim 16 wherein customer demand is estimated based on empirical data.

20. (original) The method of claim 16 further comprising the step of assigning a print job to a selected one of the autonomous cells for completion by the selected autonomous cell.

21. (currently amended) The method of claim 20 further comprising the step of dividing the print job into smaller sized lots and concurrently processing the smaller sized lots ~~on~~ using the resources of the selected autonomous cell.

22. (original) The method of claim 20 wherein the assigning step is performed by a computer system.
